

Assess Outcomes — ai-time-to-die v4 production plan

Evidence status: OBSERVED

Observation cutoff: 2026-08-14T12:15:00-07:00

Assessment question and bounded conclusion

Question: after the draft-1.9 walkthrough, the published episode masters 01-03, and the portal review vocabulary, is the ai-time-to-die vertical production-ready as a measured plan, and what does the evidence not establish?

Bounded conclusion: the production plan is ready for review as a measured, zero-spend-by-default plan. The episode template is locked at **8 segments / 57 s / 1080x1920@24** by the draft-9 KEEP (issue #28); episode masters 01-03 are rendered, verified, and published as full-motion reviews awaiting G4; the canonical corpus is measured at **79.0 s**, bounding the series to 2-3 episodes. The evidence does **not** establish baseline promotion (G4 is open), provider reliability beyond three jobs, or a production path beyond the current canonical corpus without new material.

Evidence boundary and predecessor continuity

This assessment is bounded to measured izzi repository records and portal review issues from 2026-08-13/14 only, with provider spend bounded to three Seedance jobs (590 credits total). No credential, raw provider prompt, training-conversion transfer, or hidden reasoning is in scope.

Predecessor continuity: this record supersedes `proposed_vertical_v3.md` (portal plan review `plan-vertical-ai-time-to-die-v3`) for current planning. The v3 record superseded `proposed_vertical_v2.md`, which superseded `proposal_vertical_v1.md`; each predecessor is retained in the repository and the revision ledger.

Sources in scope:

Source	Kind	Evidence status
<code>proposal_vertical_v1.md</code> (composition + transformations)	REPOSITORY	OBSERVED
<code>proposed_vertical_v2.md</code> (v2 synthesis: template, pilots, orchestration)	REPOSITORY	OBSERVED
<code>proposal_vertical_v3.md</code> (complete-vertical walkthrough)	REPOSITORY	OBSERVED
<code>draft-2.md</code> , <code>draft-8.md</code> (round plans + implementation records)	REPOSITORY	OBSERVED
<code>explore_futures.20260813.md</code> (draft-1 session record)	REPOSITORY	OBSERVED

Outcomes and contribution

Demonstrated outcomes (all OBSERVED):

- **Episode template locked:** 8 segments / 57 s / 1080x1920@24 through a nine-round draft loop; draft-9 KEEP (issue #28) with a ~0.1 min audio-only remix because the video was byte-identical to draft-8.
- **Complete vertical arc:** proposal → drafts 1-9 → Phase 6 v2 synthesis → episode masters 01-03 published full-motion, awaiting G4.
- **izzi vector text overlay:** red-on-white 20 pt two-region bullet text from OCR'd BOC CANONICAL-MARKER blocks (top BOC-9956, 14 lines, page 38; bottom BOC-9942, 9 lines, page 33) via `lane_offset_y`; glyph y-flip fixed; verified red text spans y 3..1849 (11.6k px top / 36.3k px bottom) and OCR reads both blocks.
- **Mask pipeline:** MediaPipe FaceLandmarker landmarks through the exact vertical transform with wild guilloche/moire/surface-tension textures at 50 % opacity changing every 1 s; eye1-eye2-mouth triangle assignments (blue guilloche wild @ eye1, green moire wild @ eye2, moire @ mouth) with transparent white-line compositing; PASS at draft-7 (issue #23 path).
- **Voice selection:** 29 Kokoro female stock voices materialized and reviewed; **zf_xiaoyi (V29) KEEP (issue #27);** MeanVC2 converts ~30 s of canonical dialogue in ~1-2 min on CPU.
- **Audio layout (issue #26):** canonical segments carry voice-remapped dialogue, HLT T5 carries its original audio, shinkansen bed elsewhere; verified by RMS 5022 at t=10 s vs 2001 bed-only at t=27 s.
- **Portal capabilities:** full-motion video reviews, audio media kind (29-voice bank), image-reference sets (26 images), and the plan-vertical review class now hosting this record.

Contribution framing: the contribution is a measured production pipeline and plan for a bounded remix vertical, not an invention claim over the underlying izzi generators or the Seedance provider. Claims are separated from inference in the findings ledger.

Integrated practice and research fit

- **Network topology:** rizal is the control plane (repository, receipts, review publication, orchestration dispatch, gate records); ord runs izzi/ffmpeg segment renders (T1 masks, T2/T3 overlays, T4

interjections, concat/encode); eureka runs MeanVC2 voice conversion and Higgs TTS when authorized; the provider is external and gated.

- **Cross-project reuse:** the accepted here-lies-trouble pilot stands in for T5 (zero spend by default); guilloche/moire/surface-tension generators and the house-style review vocabulary are shared across verticals.
- **Review classes:** the walkthrough exercised proofs, audio, image-reference, and now plan-vertical review — making the production plan the first reviewable artifact of every future vertical.
- **Document-type fit:** this record is an assess-outcomes + coda-share report in the devastation-pacific-house-style system, with randoma11y-full styling.

Software × data × AI methods

Corrected defects and successful audits (OBSERVED):

- Glyph y-flip between izzi font coordinates (y-up) and SVG (y-down) was only caught by OCR-verifying the rendered overlay; orientation verification is now a standing gate.
- The audio state machine was corrected at draft-8: canonical source plays its own audio and subtitles during T1a/T1b, with the shinkansen bed everywhere else.
- Tiling was abandoned after the provider resolution cap was confirmed (requested 1080p → 720x1280; requested 720p → 496x864); contain-fit composition is the production rule.

Methods and measured values:

Method / tool	Measured value
Whole-episode local render (draft-4..8)	3-5 min
Draft-9 audio-only remux	~0.1 min
MeanVC2 canonical remap	~1-2 min per 30 s window, CPU
Provider spend (round total)	590 credits (110 + 240 + 240)
Canonical corpus	79.0 s → 2-3 episode bound
Two-region text verification	y 3..1849; OCR reads BOC-9956 / BOC-9942
Audio verification	RMS 5022 (canonical t=10 s) vs 2001 (bed-only t=27 s)
Portal payload	96 MiB cap; ~86 MiB used

Generated artifacts: canonical MKVs (h264+flac), full-motion review proxies (360x640 MP4), the 29-voice audio bank, and the 26-image reference set. Unverified effects are listed in the findings ledger rather than claimed.

Limitations, counterevidence, and unresolved questions

- **Provider resolution cap persists:** every requested 1080p job delivered 720x1280, including the PRO-key submission; requested 720p delivered 496x864. Counterevidence: none of the three jobs exceeded the cap.
- **PGS subtitle burn** remains NOT-BURNED (bitmap track, no local burn path); the track is referenced, not dropped.

- **WASM byte-parity** for `izzi-svg-text-overlay.h` is not yet verified (status UNAVAILABLE).
- **Portal payload** grows with full-motion reviews; the 96 MiB cap is current but requires per-series planning rather than reactive raises.
- **Custom accents** (Asian-American, Southern) require human reference recordings; the stock Kokoro bank is sufficient for production selection but not for those accents.
- **Higgs TTS** remains gated; MeanVC2 is the production voice path.
- **Episode 03** uses a documented callback plus a provider location, not new canonical material — the corpus bound is unchanged.

Futures and next verification

All futures are INFERRED or MODELED unless stated:

Future	Status	Smallest credible verification
G4 episode KEEP for masters 01-03	INFERRED	Portal KEEP on the episode-master reviews + decision mirror to the local-object store
PGS subtitle burn pipeline	INFERRED	Bounded <code>mkvextract</code> + <code>ffmpeg</code> <code>pgssub</code> test on one canonical window
WASM byte-parity for the overlay header	MODELED	Byte-parity check against the emitted overlay header
Per-series portal payload plan	INFERRED	Budget model for the next vertical before its first full-motion publish
Higgs TTS where authorized	MODELED	One gated Higgs window on eureka with Whisper verification
Provider resolution probe on a new key/tier	MODELED	One bounded 5 s 1080p job, geometry + credits recorded

Source, claim, run, and revision ledgers

The full ledgers live in the companion manifest (`proposed_vertical_v4.assess-outcomes.manifest.json`); this section is the reader-facing summary.

Runs (OBSERVED):

Run	Procedure	Result
RUN-D1	<code>render-time-to-die-draft1.py</code> + <code>publish-video-proof.mjs</code>	57.0 s draft-1 attempted render published; REVISE #18
RUN-D2	Draft-2 rework per five findings	Round-2 render; REVISE loop
RUN-D8	Two-region text + audio state machine	y 3..1849 verified; RMS 5022/2001; PGS NOT-BURNED
RUN-D9	Audio-only remix of byte-identical draft-8	KEEP #28; template locked
RUN-MASTERS	Episodes 01-03 renders + portal publish	Full-motion episode-master reviews live, awaiting G4

Revisions (dispositions):

Revision	Predecessor	Disposition	Reason
REV-V2	proposal_vertical_v1.md	SUPERSEDED	v2 synthesis with measured estimates
REV-V3	proposed_vertical_v2.md	RETAINED_UPDATED	v3 walkthrough + plan-vertical class
REV-V4	proposed_vertical_v3.md	RETAINED_UPDATED	v4 expands to cut-v1 detail as assess-outcomes
REV-V4A	proposed_vertical_v4.assess-outcomes.md	NEW	This record + PDF

Findings: see manifest findings ledger (F-001 template locked, F-002 corpus bound, F-003 resolution cap, F-004 voice selection, F-005 PGS NOT-BURNED, F-006 WASM parity UNAVAILABLE, F-007 masters awaiting G4, F-008 payload growth), each with source_ids, counterevidence_or_limit, and next_verification.

Share summary

The ai-time-to-die walkthrough produced a measured, zero-spend-by-default production plan: an 8-segment / 57 s episode template locked by the draft-9 KEEP (#28), episode masters 01-03 published full-motion and awaiting G4, a 79.0 s canonical corpus bounding the series to 2-3 episodes, zf_xiaoyi (V29) voice selection, two-region OCR bullet text, wild 50 % opacity masks, and the portal plan-vertical review class. Limits: the provider resolution cap persists, PGS subtitles are NOT-BURNED, and WASM byte-parity is unverified.

```

Produce ai-time-to-die episodes with the accepted draft-9 pipeline: 8 segments / 57 s / 1080x1920@24, canonical dialogue remapped to zf_xiaoyi via MeanVC2, izzi red-on-white 20 pt two-region bullet text, wild 50 % opacity masks, T5 as the HLT stand-in unless provider spend is authorized, shinkansen bed elsewhere, full-motion portal review, validator passing under the 96 MiB budget, estimated against the 79 s canonical corpus bound and the measured 3-5 min per-episode render time. Keep every claim inside the declared evidence boundary, preserve evidence states, and do not promote baselines without an explicit G4 KEEP.
